PROFILE

Scientific computing researcher with a submitted doctoral thesis developed at CWI Amsterdam and TU Delft, and more than ten years of experience in numerical modelling, simulation software, and computational problem-solving. My research concerns robust numerical methods for multiphase thermodynamics and CO2-rich transport.

I am now exploring a serious transition toward high-school education. Teaching brings together the parts of research I value most: asking careful questions, making difficult ideas understandable, and helping someone gain the confidence to reason independently. I would bring broad examples, patient explanation, and an honest learning mindset to mathematics, physics, and computing education.

TEACHING DIRECTION

I am preparing for a deliberate move toward high-school education. I want to help students approach mathematics and physics through careful questions, physical intuition, visual explanation, and small computational investigations.

- Interested in high-school mathematics, physics, computational thinking, and science outreach.
- Able to connect classroom ideas to real examples from fluids, thermodynamics, electromagnetics, aerospace, and engineering.
- Committed to treating questions and mistakes as useful parts of learning, while helping students learn how to test an argument.

EDUCATION

PhD in Mechanical Engineering **2022-2026**

Delft University of Technology | Research conducted at CWI Amsterdam

Thesis submitted; defence planned for January 2027. Research focus: numerical methods for transient multiphase flow of multicomponent mixtures, with industrial collaboration from Shell Projects & Technology.

MSc in Aerospace Engineering **2012-2014**

Indian Institute of Technology Bombay, India

Research focus: finite-volume time-domain methods for electromagnetic propagation and scattering.

DOCTORAL RESEARCH AND SCIENTIFIC CONTRIBUTION

- Reformulated constrained phase-equilibrium calculations in a more efficient thermodynamic variable space.
- Coupled phase-stability and equilibrium calculations to finite-volume solvers for CO2-rich tank and pipeline transport.
- Developed thermodynamically consistent temperature-evolution models for multiphase flow.
- Investigated exact and approximate Riemann problems for real-fluid mixtures.
- Created Julia and Python research software supported by systematic validation and reproducibility workflows.

TRANSFERABLE STRENGTHS FOR EDUCATION

Clear explanation Used to moving between mathematics, physical meaning, algorithms, plots, and plain-language interpretation.	Interdisciplinary perspective Examples drawn from aerospace, energy, fluids, electromagnetics, semiconductors, finance, and computing.
Evidence and verification A research habit of examining assumptions, limiting cases, numerical results, and alternative explanations.	Computational demonstrations Able to create small programs and visual models that let students investigate a mathematical or physical question.

SELECTED PROFESSIONAL DEVELOPMENT AT TU DELFT

Graduate School courses: Scientific Storytelling; Advanced Problem Solving and Decision Making; Teamwork, Leadership and Group Dynamics; Conversation Skills; Embedding Societal Values in Research; and Scientific Integrity.

Pardeep Kumar

SCIENTIFIC COMPUTING, ENGINEERING EXPERIENCE, AND SELECTED OUTPUT

SCIENTIFIC COMPUTING STRENGTHS

Numerical methods Finite-volume and finite-difference methods, Riemann solvers, nonlinear equations, constrained optimisation, automatic differentiation, and numerical linear algebra.	Computational physics Multiphase flow, real-fluid thermodynamics, CFD, electromagnetics, wave propagation, and numerical relativity.
Scientific programming C++, Julia, Python, C#, F#, Java, MATLAB, CUDA, MPI, multithreading, and performance-oriented computation.	Research software practice Modular architecture, interoperability, testing, validation, version control, visualisation, and reproducible computation.

PROFESSIONAL EXPERIENCE

PhD Researcher in Scientific Computing — **Aug 2022-Aug 14, 2026**

Centrum Wiskunde & Informatica (CWI), Amsterdam

- Developed numerical formulations and software for multicomponent, multiphase thermodynamics and transient flow.
- Connected mathematical analysis, physical modelling, algorithm design, implementation, and validation in interdisciplinary research.

Software Engineer — **Feb-Aug 2022**

ASM International, Almere

- Enhanced and refactored a Java-based simulator for semiconductor thin-film deposition equipment.

Software Engineer — **Jun 2019-Dec 2021**

Shell, Amsterdam | Individual contributor

- Migrated numerical workflows from Python to C++ and CUDA, reducing a representative runtime from about 30 minutes to 15 seconds.
- Developed concurrent infrastructure, interoperability layers, and visualisation for process and pipeline simulation software.

Software Engineer — **Feb-Apr 2019**

Aakraya Research, Bangalore | Team of 2

- Developed regression-model generation and live profit-and-loss evaluation tools for high-frequency trading.
- Improved C++ order-book infrastructure for efficient order matching.

Software Engineer II — **May-Nov 2018**

KLA-Tencor, Chennai | Team of 2

- Developed cross-application infrastructure and a silica-wafer thickness simulation engine using C#, F#, and MATLAB.
- Implemented reusable testing libraries and an Erlang fault-tolerance mechanism with failover and recovery.

Software Engineer — **Mar 2016-Apr 2018**

Altair, Bangalore | Team of 6

- Developed shared-memory infrastructure and geometry and mesh-manipulation tools in C++.
- Modernised C++/Python bindings, built Python testing frameworks, and contributed to an MVC refactoring.

Research and Development Engineer — **Jul 2014-Mar 2016**

Fluidyn, Bangalore | Team of 4

- Developed an MPI-parallel finite-volume electromagnetic solver with higher-order spatial schemes.
- Implemented near-to-far-field transformations and extended a Navier-Stokes solver for aeroacoustic prediction.
